“The Physics of FREE Energy / Overunity Transformers”

ABSTRACT: A typical Alternating Current (AC) transformer utilizes a principle of transferring electrical energy called *mutual electromagnetic induction*. This effect described as Faraday’s Law of Induction (1831) permits a near equal amount of REAL power to be transferred between the input coil and the output coil. The “near equal amount” is the result of imperfections or losses in the transformer causing the efficiency of the same transformer to approach, but never exceed 100%.

In the mid 1980’s, a researcher by the name of Floyd Sweet developed a breakthrough transformer he called the Space Quanta Modulator (SQM) and later renamed the Vacuum Triode Amplifier (VTA) by researcher, Tom Bearden. The transformer had an efficiency exceeding 1,000,000%. Mainstream physics could not explain how this was possible. Shrouded in secrecy, the operation of Floyd’s FREE Energy / Overunity Transformer VTA device was not understood until now.

In 2002, an article published in *Infinite Energy Magazine* authored by D. L. Hotson revealed how the VTA operates utilizing what is called the “Dirac Sea of Negative Energy.” The key to understanding how FREE Energy / Overunity transformers work is through the application of a negative work function applied to transformer $T1$ shown above. This negative work function is created using magnets forced together in an opposing field configuration. The opposing field action causes the magnetic field density B to curl into Dirac COMPLEX space causing the field to become COMPLEX jB . This, in turn, forces the input electric current i_{SRC} to become COMPLEX $j i_{SRC}$. Because of this action, what is observed on a typical ammeter is a significant reduction of REAL electric current i_{SRC} . Ammeters cannot measure COMPLEX current; therefore, the REAL input

current appears to vanish. Given a COMPLEX magnetic field density jB , calculations show the field energy in a given volume V of space becomes negative, which satisfies the negative energy solution of the Dirac Equation, $-E$. This field is referred to as an *electromagnetic dampening field* and is present around transformer $T1$. Since the output power of transformer $T1$ drives a REAL load R_{LOAD} , the output electric current i_{LOAD} is REAL. Therefore, efficiencies greatly exceeding 100% are measured. This permits the construction of self-sustainable FREE Energy / Overunity devices with phenomenally large observable power gains. This lecture will show how consistent and valid using ordinary *classical analysis* works at the macro scale as well as at the quantum level.

William Alek is President and CEO of AuroraTek, Inc. AuroraTek is dedicated to bringing forth advance and exotic FREE Energy Self-Sustaining Technologies to the world. William is the inventor of the SmartPAK_{TM} / SZT_{TM} FREE Energy / Overunity Energy Management System. William has more than 30 years of experience as an embedded computer hardware, electronic hardware and software engineering consultant, and has a BSEE degree from IIT Chicago, Illinois (1979).
